

IN THE CLAIMS

Please amend the claims as follows:

Claim 1 (Original): A packet transmission system comprising:
a plurality of wireless base stations; and
one or more terminal devices belonging to one of the wireless base stations;
wherein each of the wireless base stations has a location table describing each of the terminal devices associated with a corresponding wireless base station to which the terminal device currently belongs, and is configured to exchange the information in the location table with the other wireless base stations to update the location table and to forward a received packet to a next hop along a transmission route toward a destination terminal device.

Claim 2 (Original): The packet transmission system of claim 1, wherein each of the wireless base stations is configured to broadcast a message reporting participation of a new terminal device when the new terminal device belongs to said wireless base station; and
wherein upon receiving the message, the other base stations update the location tables.

Claim 3 (Original): The packet transmission system of claim 1, wherein each of the wireless base stations further has:

a route control table describing each of the other wireless base stations in the network in association with the next hop to which the received packet is to be forwarded if a source terminal device or a destination terminal device currently belongs to one of the wireless base stations.

Claim 4 (Original): The packet transmission system of claim 3, wherein each of the wireless stations is configured to, upon receiving the packet, search the location table to

determine a wireless base station to which the source terminal device or the destination terminal device currently belongs, based on a source address or a destination address contained in the received packet, and to forward the received packet to the next hop according to the route control table.

Claim 5 (Currently Amended): The packet transmission system of claim 3, wherein the received packet contains ID information representing a transmission route used to transmit said received packet or address information ~~representing~~ representing a wireless base station to which the source terminal device or the destination terminal device currently belongs; and

wherein each of the wireless base stations is configured to determine the next hop to which the received packet is to be forwarded from the route control table based on the ID information of the transmission route or the address information of the wireless base station contained in the packet.

Claim 6 (Currently Amended): A wireless base station constituting, together with other wireless base stations, a packet transmission system using a wireless packet network, comprising:

a location table describing each of terminal devices currently participating in the network associated with a corresponding one of the wireless base stations to which said terminal device currently belongs;

a route control table describing information items about transmission routes used in the packet transmission system, each information item being associated with one of the other wireless base stations assuming that said one of the other wireless ~~basestations~~ base stations is related to a source or a destination;

a packet receiving unit configured to receive a packet;
a route determination unit configured to determine a route used to transmit the received packet based on information contained in the received packet; and
a packet transmission unit configured to transmit the packet to a next hop according to the route control table.

Claim 7 (Original): The wireless base station of claim 6, wherein the route determination unit identifies a terminal device indicated by a source address or a destination address contained in the received packet, determines a wireless base station to which the identified terminal device currently belongs with reference to the location table, and finds the next hop in the route control table.

Claim 8 (Original): The wireless base station of claim 6, wherein the packet transmission unit broadcasts a message packet reporting participation of a new terminal device when the new terminal device belongs to the wireless base station.

Claim 9 (Original): The wireless base station of claim 6, wherein when the receiving unit receives a message packet reporting a new terminal device having belonged to one of the other wireless base stations, the route determination unit updates the location table.

Claim 10 (Original): The wireless base station of claim 6, wherein when the receiving unit receives a packet from a source terminal device belonging to this wireless base station, the packet transmission unit writes an address of a destination side wireless base station to which a destination terminal device currently belongs in the packet, and then transmits the packet to the next hop according to the route control table.

Claims 11-28 (Canceled).
